Title: The Role of Artificial Intelligence in Enhancing Cybersecurity and Internal Audit

IEEE Citation

A. Alshahrani, "The Role of Artificial Intelligence in Enhancing Cybersecurity and Internal Audit," in *2024 ASU International Conference in Emerging Technologies for Sustainability and Intelligent Systems (ICETISIS)*, North Cyprus, Cyprus, 2024, pp. 1006-1011. doi: 10.1109/ICETISIS61701.2024.10428353

Summary

This paper explores how artificial intelligence (AI) can revolutionize cybersecurity and internal auditing by automating complex tasks, detecting threats in real time, and improving overall organizational resilience. Drawing from a comprehensive literature review and case studies, the author, Abdulaziz Alshahrani, argues that traditional methods in these fields are increasingly inadequate against evolving digital risks, such as sophisticated cyberattacks and compliance challenges. AI emerges as a game-changer, leveraging machine learning algorithms, natural language processing, and predictive analytics to address these gaps. The study highlights AI's dual role: in cybersecurity, it enables proactive threat hunting and anomaly detection; in internal auditing, it streamlines risk assessment and fraud identification.

The methodology combines a systematic review of over 50 recent studies (from 2018-2023) with practical examples from industries like finance and healthcare. Key AI applications discussed include intrusion detection systems powered by deep learning, which analyze network traffic patterns to flag anomalies faster than human auditors, and automated auditing tools that process vast datasets for inconsistencies in financial records. The paper also examines integration challenges, such as data privacy concerns under regulations like GDPR and the need for ethical AI frameworks to prevent biases in decision-making.

Empirical findings reveal significant benefits: organizations adopting AI-based tools report up to 40% faster incident response times in cybersecurity and a 25% reduction in audit errors. Case studies, including a bank's use of AI for real-time fraud alerts and a manufacturing firm's AI-driven compliance audits, demonstrate measurable ROI through cost savings and enhanced accuracy. However, the author cautions about risks like adversarial AI attacks that could manipulate detection models.

In conclusion, Alshahrani advocates for hybrid human-AI models in cybersecurity and internal auditing, emphasizing the need for upskilling professionals and robust governance. The paper calls for further interdisciplinary research to refine AI's ethical deployment, positioning it as essential for sustainable digital transformation in high-stakes environments. Overall, it's a timely call to action for businesses to harness AI not just as a tool, but as a strategic imperative for safeguarding assets and ensuring accountability.
